GENERAL INFORMATION:
APPLICANT: Kovalic, David K.
TITLE OF INVENTION: NUCLEIC ACID MOLECULES AND OTHER MOLECULES ASSOCIATED WITH
TITLE OF INVENTION: PLANTS AND USES THEREOF FOR PLANT IMPROVEMENT
TITLE OF PAPPLICATION OF PLANTS AND USES THEREOF FOR PLANT IMPROVEMENT
FILE REPERENCE: 38-21(53377)B
CURRENT APPLICATION NUMBER: US/10/739,930
CURRENT PILING DATE: 2003-12-18
NUMBER OF SEQ ID NOS: 11088
SEQ ID NOS: 11088
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                APPLICANT: Cao, Yongwein Title Or INVENTION: Nucleic Acid Molecules and Other Molecules Associated With TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement PILE REPRENCE: 38-21(53313) B CURRENT APPLICATION NUMBER: US/10/425,114A CURRENT FILING DATE: 2003-04-28 NUMBER OF SEQ ID NOS: 73128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pseudomonas aerugi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                           January 28, 2004, 13:02:13; Search time 41 Seconds (without alignments) 73.556 Million cell updates/sec

The present invention describes antigenic Pseudomonas aeruginosa proteins (P1). The P. aeruginosa proteins have antibacterial activity and can be used in vaccines and as antagonists. The proteins or their fragments, or antibodies are useful in the detection and/or diagnosis of P. aeruginosa. They are also useful for producing a vaccine and inducing an immune response against P. aeruginosa infection. An agent capable of antagonising, inhibiting or otherwise interfering with the function or expression of P1 are useful in the manufacture of a medicament for the treatment or prophylaxis of P. aeruginosa infections. The present sequence represents a probable P. aeruginosa infections. N-terminal peptide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                This peptide is the N-terminal fragment of a novel Pseudomonas aeruginosa protein antigen, Pa60. This fragment could be used for diagnostic detection of P. aeruginosa by forming complexes with specific antibodies, particularly in patients with cystic fibrosis (by analysis of mucus, e.g. in saliva), or in vaccines or immunogenic compositions to treat or prevent infection by P. aeruginosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antigenic Pseudomonas aeruginosa proteins, useful in the detection and/or diagnosis of P. aeruginosa infections and for producing vaccines against P. aeruginosa -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sizer PJH, Wilkinson MC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a library of DNA fragments of Escherichia colistrains comprising polynucleotides (ABA88577-ABA88729 and ABA89533) and and encoded proteins (ABB52459-ABB52919 and ABB52954-ABB53094) of nature BZ/D+A. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E. coliinfections. The polypeptides are useful for determining the phylogenic group of a given. E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of nature B2/D+A-
                                                                                                                                                                                                                                                                                                                         Escherichia coli; B2/D+A-; antiinflammatory; antibacterial; immunosuppressive; extra-intestinal infection; phylogeny; meningitis; systemic infection; non-diarrhoeal infection; septicaemia; phylosphritis; antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a deoxyribokinase enzyme. This enzyme is involved in the biosynthesis of deoxyribonucleosides, and is used in the method of the invention. The specification describes a method for the in vitro enzymatic synthesis of deoxyribonucleosides. The method comprises reacting deoxyribose 1-phosphate and a nucleobase to form a deoxyribonucleoside and an inorganic phosphate. Bnzymes which may be used in the method of the invention include thymidine phosphorylase, purine nucleoside phosphorylase, phosphopentose aldolase, fructose 1,6-diphosphate aldolase, and nucleoside 2-deoxyriboshtransferase.
                                                                                            Deoxyribonucleoside; deoxyribose 1-phosphate; thymidine phosphorylase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

The invention relates to isolated nucleic acids encoding plant stress response proteins (including peptide-methionine sulphoxide response proteins (including peptide-methionine sulphoxide contents) as ABUSS148-ABUSS246 (or a protein 80% identical to them) from Zea mays, Oryza sativa, Glycine max, Or Triticum aestivum. Also included are expression cassettes, transformed host cells, cransgenic plants/seeds, modulating the level of peptide-methionine sulphoxide reductase in a plant and a computer system/dara processing system for identifying, analysing, or modelling a genetic sequence. The plant nucleic acid is useful in developing strategies to improve plant response to stress (e.g. drought, heat, radiation or pathogen attack), engineering plants with increased disease and stress cresistance, manipulating DNA repair and recombination efficiency, manipulating intracellular protein transport, and improving/protecting grain flavour. The nucleic acids may also be used as probes or cranscripts, for recombinant expression of encoded polypeptides, as immunogens in preparing or screening antibodies, and in sense or immunogens in preparing or screening antibodies, and in sense or continued antibodies specifically immunoreactive with the protein, and in assays continued protein antibodies specifically immunoreactive with the protein, and in assays or arragonists or antagonists.
                                                                                                                                                                                                                                                                     New peptide-methionine sulfoxide reductase and nucleic acids, useful in improving plant response to stress, engineering plants with increased disease and stress resistance, or and improving/protecting grain flavor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to the genome sequence of Listeria monocytogenes ED-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins carpeased from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and to hiosynthesis and biodegradation, especially biosynthesis of Vitemin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes related diseases. In addition, the genome caquence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                        Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and

HIV-type retrovirus; MVP-5180/91; ECACC V 92092318; antigen; assay kit; detection; antibody; immune deficiency; vaccine.
                                                                           MVP-5180/91 has been isolated from peripheral lymphocytes of a patient, from the Cameroons, with immune deficiency. It grows in the same human cells as HIV-1; like HIV it produces an Mg-dependent reverse transcriptes (RT), although this is 3 to 7 kD smaller in Western blots than the enzyme from HIV-1 or -2. It is less reactive than HIV-1, but more reactive than HIV-2, against p24-specific antibodies and its gp41 transmembrane protein reacts with antibodies in sera of African patients but not (or only weakly) with sera of German patients.
                                                                                                                                                                                                                                                                     The virus consists of RNA in a peg-shaped core made of p24 subunits surrounded by an outer core of p17 and then a glycoprotein envelope which, apart from host-cell derived lipids, comprises gp41 and envelope protein gp120 (which can bind to the CD4 receptor). Related viruses have at least 75% homology over the entire genome with max. differences for the various regions LTR and NBF 10%, POL 12%, GAG 14%, VIF 15% and BNV 22%. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New HIV-type retrovirus and corresponding cDNA, recombinant DNA and antigen - used for detecting retro-viruses that cause immune deficiency and to prepare vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 40; DB 15; Length 498; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococus aureus, Salmonella typhi, Klebsiella preumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The cinvention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention antibodies capable of binding to the expresse proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen car of the promotogous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

On the printed specification, but was obtained in electronic form part and promat directly from WIPO at sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in production of benzodiazephies, in particular anthramycin. The protein of encoded by the novel nucleic acid of the invention or a protein of 200 consecutive amino acids of that protein are useful for modifying a biological molecule that is a substrate for a polypeptide encoded by an anthramycin gene cluster. The anthramycin gene cluster present in a bacterium, preferably Escherichia coli strain DH10B having accession nos. IDAC 040602-1 and IDAC 040602-2, is useful for producing an anthramycin compound or anthramycin analogue. The genes and proteins provide the machinery for producing novel compounds based on the structure of anthramycins, and allow direct manipulation of anthramycin and related chemical structures via chemical engineering of the enzyme involved in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated nucleic acid molecule involved
                    This invention describes the isolation of a novel HIV-type retrovirus called MPP-5180/91 (EACKC V 9209218). Antigens produced from this product can be used in an assay kit for detecting antibodies against viruses that cause immune deficiency, preferably where the assay is a Western blot. ELISA or fluorescence immunoassay. MVP-5180/91, cDNA and/or antigen can be used for detecting retroviruses that cause immune deficiency and to prepare vaccines. This sequence represents an HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful for directly manipulating benzodiazepines and related chemical structures by chemical engineering of enzymes involved in anthramycin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated nucleic acid involved in benzodiazepines production,

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLioleth-ABLioli), expressed DNA sequences (ABLioleth-ABLioli), and the encoded proteins
biosynthesis of anthramycin, modifications which may not be presently sible by chemical methodology because of complexity of the structures. genes and proteins are also useful to introduce chemicals handles onormally inert positions that permit subsequence chemical
                                                                                                                                                                                        modification, achieving development of novel benzodiazepines, and generating a focused library of analogues around a benzodiazepine lead candidate to fine-tune the compound for optimal properties. The nucleic acids may be used as probes to identify and isolate DNAs encoding polypeptide sequences, and related nucleic acids. The nucleic acids useful for preparing the enzymes involved in the synthesis of anthramycine. The polypeptides are useful in a variety of biochemical reactions and for generating monoclonal or polyclonal antibodies. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (ABB57737-ABB72072). The sequence data for this part of the printed The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to isolated polymuciecitie (1) and to polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) is useful for generating antibodies against it, detecting or (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, foremaics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Commission acid sequences data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIFO expectives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Yeast, protein-protein interaction, Selected Interacting Domain, SID (RTM); secretion yield; cancer, neurodegenerative disease; fungicide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                       cerevisiae polypeptides, comprising two Selected Interacting Domain (SID) polypeptides as bait and prey proteins. A pharmaceutical composition comprising the complex is useful for preventing or treating candida infection, cancer and neurodegenerative diseases in a human or animal, preferably in a mammal. This sequence represents a SID polypeptide of the
                 interacting Saccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                The present invention relates to complexes between Saccharomyces cerevisiae Selected Interacting Domain (SID (RTM)) proteins and coding sequences. The protein complexes of S. cerevisiae are useful in drug development, in screening drugs or agents that modulate the interaction of proteins, for developing yeast strains with better secretion yield of protein, and in gene therapy. The protein complexes, polypeptides and polymucleotides are useful for preventing or treating Candida infection, cancer or neurodegenerative diseases in humans or animals. The present

immunity against cancer. The compounds provided include polypeptides that contain at least one immunogenic portion of one or more SPAS-1 protein and DNA molecules encoding them or antigen obtained from transgenic adenocarcinoma mouse prostate (TRAMP)-C2 tumour cells. The immunogenic portion of the SPAS-1 human homologue polynucleotides sequence, SPAS-1 antibody or its antigen-binding fragment, the antigen-presenting cell, the T cell population and the pharmaceutical compositions are useful for inhibiting the development of a cancer in a patient, specifically prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney, chronic lymphocytic leukaemia or germ cell cancer. In particular, these compounds are useful as vaccines for inducing protective immunity against cancer. They are also useful for diagnosing cancer and monitoring cancer. They are also useful for diagnosing cancer and monitoring cancer progression. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       prostate; breast; cervix; ovary; placenta; colon; brain; lung; kidney; chronic lymphocytic leukaemia; germ cell; vaccine; cytostatic; TRAMP; transgenic adenocarcinoma mouse prostate; mutant; mutein.

immunity against cancer. The compounds provided include polypeptides that contain at least one immunogenic portion of one or more SPAS-1 protein and DNA molecules encoding them or antigen obtained from transgenic adenocarcinoma mouse prostate (TRAMP)-C2 tumour cells. The immunogenic portion of the SPAS-1 human homologue polynucleotides sequence, SPAS-1 antibody or its antigen-binding fragment, the antigen-presenting cell, the T cell population and the pharmaceutical compositions are useful for inhibiting the development of a cancer in a patient, specifically prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney, chronic lymphocytic leukaemia or germ cell cancer. In particular, these compounds are useful as vaccines for inducing protective immunity against cancer. They are also useful for
                                                                                                                                                                    The invention relates to compounds and methods for inducing protective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA. sequences (ABL01840-ABL30512) and the encoded proteins
            that contain at least one immunogenic portion of one or more SPAS-1 protein and DNA molecules encoding them or antigen obtained from transgenic adenocarcinoma mouse prostate (TRAMP)-C2 tumour cells. The immunogenic portion of the SPAS-1 human homologue polynuclectides sequence, SPAS-1 antibody or its antigen-binding fragment, the antigencempositions are useful for inhibiting the development of a cancompositions are useful for inhibiting the development of a cancomposition, specifically prostate, breast, cervix, ovary, placenta, colon, brain, lung, kidney, chronic lymphocytic leukaemia or germ cell ancer, in particular, these compounds are useful as vaccines for inducing protective immunity against cancer. They are also useful for diagnosing cancer and monitoring cancer progression. The present sequence is murine normal SPAS-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                      Gaps

the specification. The primer sets can be used in antisense therapy and the specification. The primers are useful for synthesising polymod-bottides, particularly full-length cDNAs. The primers are also useful for the sing polymod-bottides, particularly full-length cDNAs. The primers are also useful for the batch of the full-length cDNAs. The primers also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises a 1'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of oligonucleotide comprises at least 15 nucleotides and the combination of the comprise of the comprise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

The invention relates to novel human lung cancer polynucleotide (I) and polypeptides (II). (I) and (II) are useful in pharmaceutical compositions, such as vaccines, for the diagnosis and treatment of lung cancer. The polynucleotides are also useful as probes or primers for nucleic acid hybridisation. ABK24314-ABK24397 represent human lung cancer coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yokoi H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Coryneform bacterium; amino acid synthesis; vitamin; saccharide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 12;
                                                                                                                                                                                                                                                                                                                                                New lung tumour polypeptides and polynucleotides, useful in pharmaceutical compositions, such as vaccines, for treating preventing lung cancer, or as probes or primers for nucleic hybridisation.
